CASE STUDY / SAAS / FORCOACH.IO

FORCOACH

One schedule, one invoice, every studio: the operating system for fitness instructors who teach across multiple studios.

PRODUCT	BUILT WITH	STATUS
Web platform for multi-studio fitness instructors	Next.js · NestJS · Supabase · Stripe	Live, paid SaaS at forcoach.io

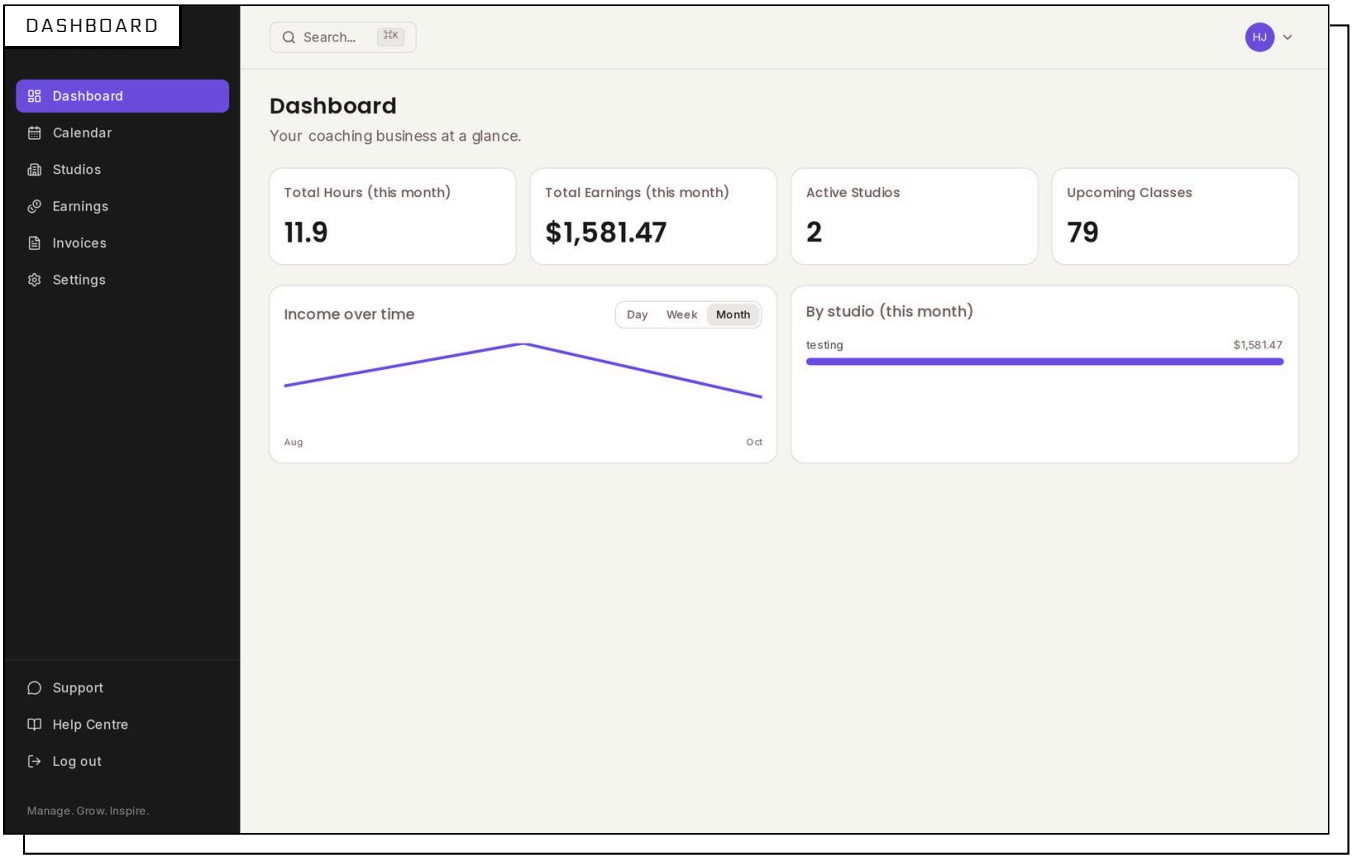

01 / PROJECT OVERVIEW

Project Overview

One schedule, one invoice, every studio: the operating system for fitness instructors who teach across multiple studios.

FORCOACH is a SaaS platform for freelance fitness coaches (yoga, Pilates, barre, cycling, HIIT) who teach at several studios at once. These coaches usually juggle a different booking system per studio, track classes in spreadsheets, and rebuild invoices by hand at the end of every month. FORCOACH brings every class into one calendar, calculates earnings automatically from each studio's pay rules, and turns taught classes into professional invoices in a few clicks.

I designed and built the full product: a Next.js 16 web app, a NestJS REST API, and a self-hosted Supabase backend (PostgreSQL + Auth). Stripe runs the subscription billing. Everything runs in Docker containers behind Caddy on a VPS, and Sentry provides error monitoring.

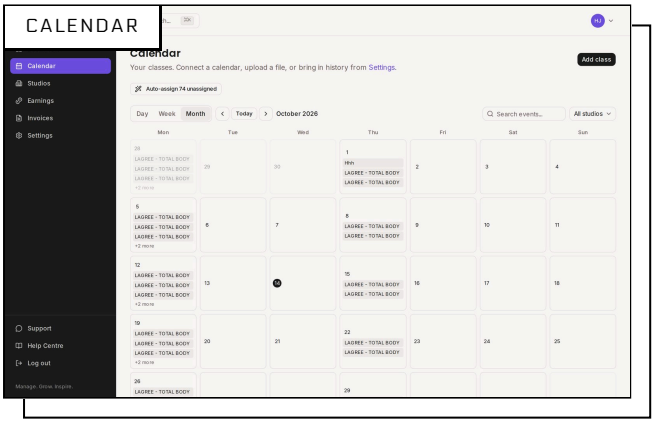

THE COACH'S DASHBOARD: HOURS, EARNINGS, ACTIVE STUDIOS AND UPCOMING CLASSES AT A GLANCE.

02 / CORE FEATURES

Core Features

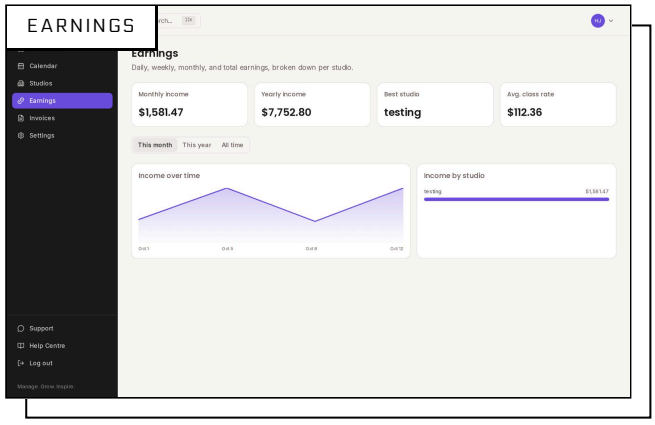

- Unified calendar that merges classes from every studio into one schedule, with day, week and month views
- Per-studio pay rules: per class, or per attendance with tiered brackets, plus per-class rate overrides
- One-click invoice generation from taught classes, with business, SIRET, VAT and bank details pre-filled
- Stripe subscriptions: monthly and yearly plans, 15-day free trial, promo codes and a customer portal
- Built-in blog, help centre and in-app support messaging
- Google Calendar sync and studio calendar (ICS) feed import, with automatic class-to-studio matching by keyword
- Earnings dashboard by month, year and studio, with income trends
- Multi-currency support (EUR, GBP, USD, AED, KWD)
- Admin panel for user management, free-access grants, yearly discounts and a support inbox
- Secure authentication: email + 6-digit code confirmation, Google sign-in and Cloudflare Turnstile bot protection

CALENDAR

EVERY STUDIO'S CLASSES IN ONE MONTH VIEW.

EARNINGS

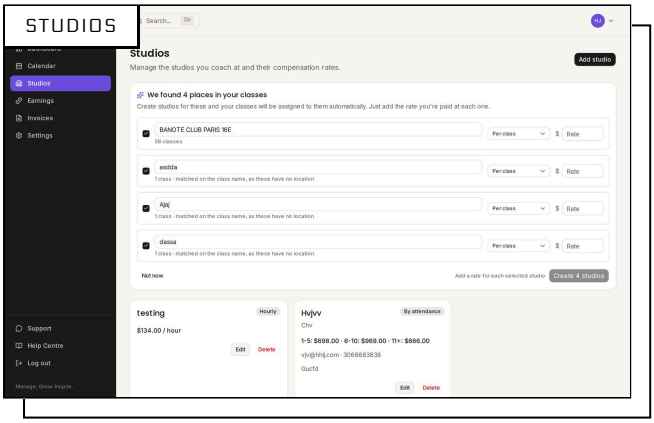

MONTHLY AND YEARLY INCOME, BROKEN DOWN PER STUDIO.

03 / WHAT SET THIS PROJECT APART

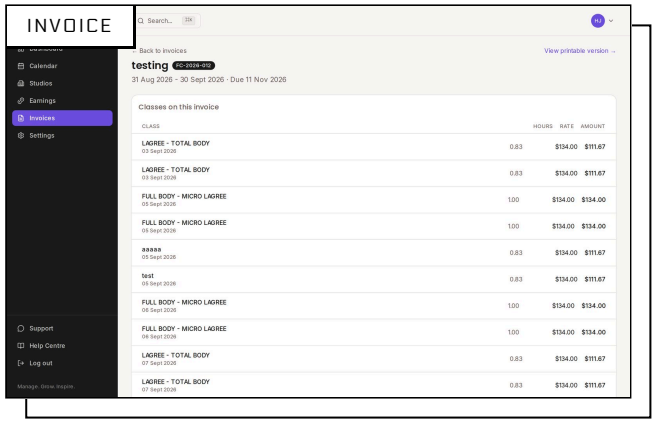

What Set This Project Apart

The hardest problem was turning messy, external calendar data into accurate money. Each studio publishes classes through a different booking system, so the same coach's schedule arrives as inconsistent ICS feeds and Google Calendar events: different titles, time zones, duplicates and cancellations. FORCOACH re-syncs these feeds on a schedule and updates existing classes instead of duplicating them. It matches each event to the right studio using per-studio keywords, then applies that studio's pay model, including attendance-based tiers, to produce earnings a coach can trust and invoice from.

> The differentiator is that FORCOACH is built around the instructor, not the studio. Every other tool in this space (Mindbody, bsport and others) serves studio owners and sees one studio at a time. FORCOACH sits on top of all of them and gives the freelance coach a single place for their whole working life: schedule, income and invoicing across every studio they teach at.

CLASSES MATCHED TO STUDIOS, EACH WITH ITS OWN PAY RATE.

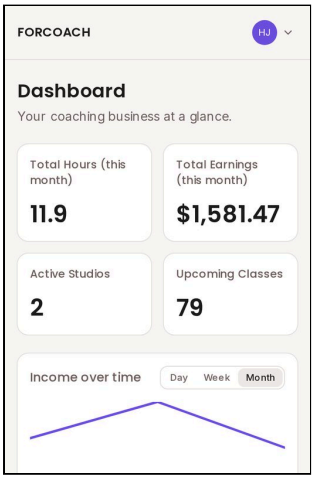

AN INVOICE BUILT FROM TAUGHT CLASSES, HOURS AND RATES.

04 / DELIVERY

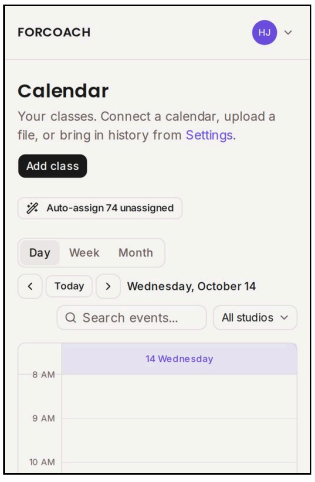

Here's how I made it work

- [x] Turned the client's brief into a full documentation set (PRD, SRS, data model, business rules, invoice rules and QA plan) before writing code
- [x] Designed the PostgreSQL schema with row-level security, so every coach can only ever read their own data
- [x] Built a NestJS API organised by module: studios, events, earnings, invoices, billing, support, admin and blog
- [x] Wrote scheduled sync jobs for ICS feeds and Google Calendar that update existing classes instead of creating duplicates
- [x] Implemented the earnings engine for per-class and tiered per-attendance pay, with rate overrides
- [x] Integrated Stripe Checkout, the customer portal and webhooks, with server-side subscription enforcement and admin access overrides
- [x] Self-hosted Supabase with custom Auth configuration: Google OAuth, PKCE, branded email templates with the confirmation code up front, and Turnstile captcha verified on the auth server
- [x] Built GDPR-friendly account deletion that cancels the Stripe subscription and removes all of the coach's data
- [x] Deployed everything with Docker Compose and Caddy (automatic HTTPS) on a VPS, with Sentry error tracking and versioned SQL migrations
- [x] Iterated weekly on the client's feedback on design, pricing, currencies and onboarding

05 / TECH STACK

Tech Stack

LAYER	TECHNOLOGY
Frontend	Next.js 16 (App Router, Server Actions), React, TypeScript
UI	Tailwind CSS, shadcn/ui
Backend API	NestJS (TypeScript), scheduled jobs
Database	PostgreSQL (self-hosted Supabase) with row-level security
Authentication	Supabase Auth (GoTrue): email/password, Google OAuth, PKCE
Payments	Stripe Checkout, Billing Portal, Webhooks
Integrations	Google Calendar API, ICS calendar feeds
Email	SMTP via Resend, custom HTML templates
Security	Cloudflare Turnstile, server-side subscription guards
Monitoring	Sentry
Infrastructure	Docker Compose, Caddy (auto HTTPS), Linux VPS

06 / PROJECT IMPACT

01 Took the product from an idea to a live, paid SaaS at forcoach.io	02 Coaches see every class from every studio in one calendar, with no more switching between booking apps
03 Earnings are calculated automatically, including attendance-based pay, so there are no spreadsheets	04 Monthly invoicing went from manual paperwork to a few clicks
05 Recurring revenue through Stripe, with trials, discounts and self-service billing	06 Spam and bot sign-ups blocked with Cloudflare Turnstile and code-based email confirmation
07 Privacy built in: per-user data isolation and full self-service account deletion	08 The same API now powers the FORCOACH iOS and Android companion app
