CASE STUDY / EVENT SAAS / LARAVEL & REACT

Tech Café

A real-time event engine for high-traffic live events: QR check-ins, role-based dashboards, and instant activity tracking, all built to stay fast under load.

PRODUCT	BUILT WITH	ROLES
Event management SaaS platform	Laravel · React.js · HTML5 QR	Admin · Moderator · Attendee

01 / PROJECT OVERVIEW

Project Overview

A real-time event engine for high-traffic live events: QR check-ins, role-based dashboards, and instant activity tracking, all built to stay fast under load.

Tech Café is a subscription-ready, full-stack event management SaaS platform that streamlines attendee engagement, station management, and real-time event tracking. Built as a custom web application with a modular full-stack architecture, it supports Admin, Moderator, and Attendee roles.

As Senior Full-Stack Developer, I built the backend API development in Laravel and a component-based React.js frontend, delivering QR-based check-ins, role-based authentication, custom dashboards, and an event-driven architecture optimized for high concurrent usage during live events.

02 / CORE FEATURES

- [x] QR code system for attendee → station and moderator → attendee actions
- [x] Custom real-time dashboards for admins and moderators
- [x] Role-based authentication and authorization (Admin, Moderator, Attendee)
- [x] Scalable Laravel API backend with events, jobs, and optimized DB queries
- [x] Component-based, fully responsive React.js frontend
- [x] Real-time event flow management and activity monitoring
- [x] Event-driven backend architecture optimized for high-traffic events

03 / WHAT SET THIS PROJECT APART

What Set This Project Apart

Live events are unforgiving: hundreds of attendees check in at once, and any lag or downtime is visible instantly. The core challenge was building an event-driven Laravel backend with optimized queries that stays fast and stable under heavy concurrent load, while a QR system handles rapid, reliable check-ins across stations.

> The build pairs that performance backbone with a clean, role-based experience: separate real-time dashboards for admins and moderators, secure role-based authorization, and a responsive React.js frontend converted pixel-accurately from Figma: an enterprise SaaS designed for scale from day one.

04 / HERE'S HOW I MADE IT WORK

- [x] Built scalable API development with Laravel and an event-driven architecture
- [x] Implemented secure authentication and role-based authorization
- [x] Developed a QR-based check-in system using a stable HTML5 QR solution
- [x] Optimized database queries for live, high-concurrency usage
- [x] Built a component-based, fully responsive React.js frontend
- [x] Converted detailed Figma designs into React without performance loss
- [x] Delivered a complete SaaS under a tight deadline with stability at scale

05 / TECH STACK

Tech Stack

LAYER	TECHNOLOGY
Frontend	React.js (component-based, responsive UI)
Backend	Laravel (backend API development, events & jobs)
Architecture	Modular full-stack, event-driven, scalable SaaS
Security	Role-based authentication & authorization
Key Systems	QR code system, real-time dashboards, HTML5 scanning

06 / PROJECT IMPACT

01 Delivered a production-ready event management SaaS platform	02 Enabled real-time QR-based tracking for live, high-traffic events
03 Improved operational efficiency with automated real-time dashboards	04 Secured workflows with role-based access across three user roles
05 Praised by clients for speed, reliability, and scalability
